

A very fat container can spend all free space and avoid new docker builds. A fat container make deploy a slow and error prone process.

the Fat DOCKER!

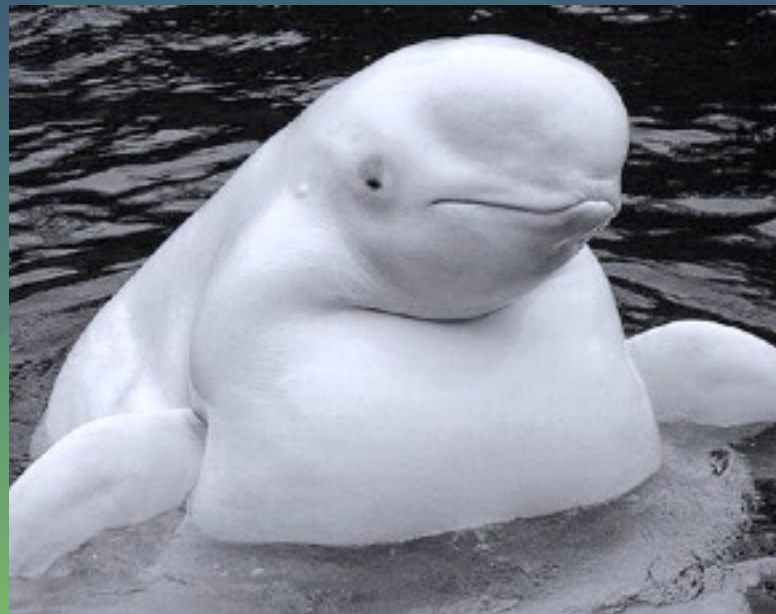

The Fat DOCKER!

- Do you inspect your Dockerfiles?
- Do you have Docker builds correctly configured?
- Do you control where layers are built?

A very fat container can spend all free space and avoid new docker builds. A fat container make deploy a slow and error prone process.

The evil **DOCKER** twin!

- Do you think that a containers registry is a complex overhead?
- You build a small number of containers?
- Your team don't know how to write good Dockerfiles?
