The TIP Of the iceberg

- When your agents go down are less problematic if agents are deploy thru resilient infrastructure (like Kubernetes).
- Containers from scratch are blessed simplicity, use often as you can.
- Deploy Critical software thru configurations (and trusted software) over complex code.
- You know about security just apply your knowledge in your CI/CD
- Don't let that your automation tools become automated Insecurity

Who WATCH the watchers?

- Who will watch the watchers? Manage your CI/CD as a critical software (because it is).
- Assume that you have a lot of potential *insiders* attackers.
- Protect your C.I. as your production systems.
- Monitoring. Always monitoring. Not only in the building step.
